

POOL START-UP

- 1) FILL WATER HALF WAY UP SKIMMER OPENING.
- 2) SET FILTER HANDLE TO **BACKWASH**.
- 3) TURN ON PUMP. RUN FOR APPRX 10 SECONDS THEN TURN OFF PUMP.
- 4) SET FILTER HANDLE TO **RINSE**.
- 5) REPEAT STEP 3.
- 6) SET VALVE HANDLE TO **FILTER** & TURN ON PUMP.
- 7) ADD START-UP CHEMICALS
 - a. Remove skimmer lid and basket, set aside. Add bags of SHOCKWAVE to pool by pouring slowly through skimmer (pump must be running to do this)
 - b. Add CONDITIONER/STABILIZER to pool by pouring slowly through skimmer (pump must be running to do this)
- 8) Replace skimmer basket and lid.
- 9) It is recommended to let the pump run 24/7 for at least the first week. The more the pump runs the easier it is to maintain a clean pool. However, it's possible to run the pump less. You just have to find a schedule that works for your pool.
- 10) **DO NOT** BACKWASH for 4 days. This allows the conditioner/stabilizer to dissolve completely and be dispersed into the water.
- 11) Test the water or bring a sample to Backyard Pools for testing. pH and Alkalinity might need to be adjusted.
- 12) Your pool also came with Liquid Chlorine (labeled Pool Shock). This can be added at a rate of 11 ounces per 10,000 gallons. It would be advisable to purchase 3" Chlorine Tablets within a week. The chlorine tabs can be added to the skimmer basket to maintain a 1-2 ppm free chlorine level.

PLEASE CALL OR COME SEE US AT BACKYARD POOLS FOR ANY QUESTIONS YOU MIGHT HAVE ABOUT YOU POOL. 662-842-2728

THANK YOU!!
